We are seeking international partners for work on call 2409 - Area 1A - GNSS Introduction in the Rail Sector.

We are a well known engineering firm based in Spain (www.sener.es). We have a broad technical development capability and experience in GNSS/INS/odometer based real-time navigation systems, and in development of safety-critical software. We have also a clear understanding of the specific rail requirements and have developed software tools for demonstration of GNSS/ERTMS interoperability.

This note is to let you know that we would be interested to form part of a sound Consortium involving all major actors: rail signalling expert, regulator, operator, receiver manufacturer, integrator, and rolling stock manufacturer (list not meant to be exclusive).

If your organization is interested in participating, or if you are already in the process of forming a Consortium for this call, please do not hesitate to contact us for further discussion.
